

Cpu Scheduling Algorithms Exercise With Solution

****Understanding CPU Scheduling Algorithms Exercise with Solution**** **cpu scheduling algorithms exercise with solution** is a topic that often challenges students and professionals diving into operating systems. CPU scheduling is a fundamental concept that determines how processes are managed and executed by the CPU, impacting system efficiency and responsiveness. Working through exercises with clear solutions not only reinforces theoretical knowledge but also sharpens problem-solving skills in real-world scenarios. In this article, we'll explore various CPU scheduling algorithms through practical exercises, providing detailed explanations and solutions to deepen your understanding.

What Are CPU Scheduling Algorithms?

Before jumping into exercises, it's important to grasp what CPU scheduling algorithms are and why they matter. A CPU scheduling algorithm is a method used by the operating system to decide which process in the ready queue will get CPU time

next. Since multiple processes may be ready to run simultaneously, the scheduler must prioritize and allocate CPU efficiently to maintain fairness, minimize waiting time, and optimize throughput. Several popular scheduling algorithms exist, each with unique characteristics: - First-Come, First-Served (FCFS) - Shortest Job Next (SJN) / Shortest Job First (SJF) - Priority Scheduling - Round Robin (RR) - Multilevel Queue Scheduling Understanding these algorithms through exercises helps clarify their behavior under different workloads.

Why Practicing CPU Scheduling Algorithms Exercises with Solution Is Essential

Studying CPU scheduling theory is one thing, but applying it through exercises is where real learning happens. Exercises force you to: - Calculate waiting and turnaround times for various scheduling methods. - Visualize Gantt charts representing process execution sequences. - Compare algorithm performance based on different metrics. - Understand the trade-offs between fairness, efficiency, and complexity. Having solutions at hand allows you to verify your approach, correct misunderstandings, and gain confidence.

Common CPU Scheduling Algorithms

Exercises and Their Solutions

Let's dive into some practical exercises featuring common CPU scheduling algorithms. Each section will present a problem, walk through the solution, and explain the reasoning behind each step.

Exercise 1: First-Come, First-Served (FCFS) Scheduling

Problem: Given the following processes with their arrival times and burst times, calculate the average waiting time and average turnaround time using FCFS scheduling.

Process	Arrival Time	Burst Time
P1	0	4
P2	1	3
P3	2	1
P4	3	2

Solution: In FCFS, processes are scheduled in the order they arrive.

1. **Timeline:** - P1 starts at 0 (arrival) and finishes at 4. - P2 starts at 4 and finishes at 7 (4 + 3). - P3 starts at 7 and finishes at 8 (7 + 1). - P4 starts at 8 and finishes at 10 (8 + 2).

2. **Waiting Time (WT):** WT = Start time - Arrival time - P1: 0 - 0 = 0 - P2: 4 - 1 = 3 - P3: 7 - 2 = 5 - P4: 8 - 3 = 5

3. **Turnaround Time (TAT):** TAT = Completion time - Arrival time - P1: 4 - 0 = 4 - P2: 7 - 1 = 6 - P3: 8 - 2 = 6 - P4: 10 - 3 = 7

4. **Average Waiting Time:** $(0 + 3 + 5 + 5) / 4 = 13 / 4 = 3.25$ units

5. **Average Turnaround Time:** $(4 + 6 + 6 + 7) / 4 = 23 / 4 = 5.75$ units

Insights: FCFS is simple but can lead to the

“convoy effect” where shorter processes wait long if a long process arrives first.

Exercise 2: Shortest Job First (SJF) Scheduling (Non-preemptive)

****Problem:**** Using the same processes as in Exercise 1, calculate average waiting and turnaround times using SJF scheduling. ****Solution:**** SJF schedules the process with the shortest burst time next. 1. ****Process order:**** - At time 0, P1 arrives; it starts execution. - P1 runs from 0 to 4. - At time 4, P2, P3, P4 have all arrived. Among them, P3 has the shortest burst time (1). - P3 runs from 4 to 5. - Next shortest is P4 (2), runs from 5 to 7. - Then P2 (3), runs from 7 to 10. 2. ****Waiting Time:**** - P1: $0 - 0 = 0$ - P2: $7 - 1 = 6$ - P3: $4 - 2 = 2$ - P4: $5 - 3 = 2$ 3. ****Turnaround Time:**** - P1: $4 - 0 = 4$ - P2: $10 - 1 = 9$ - P3: $5 - 2 = 3$ - P4: $7 - 3 = 4$ 4. ****Average Waiting Time:**** $(0 + 6 + 2 + 2) / 4 = 10 / 4 = 2.5$ units 5. ****Average Turnaround Time:**** $(4 + 9 + 3 + 4) / 4 = 20 / 4 = 5$ units ****Insights:**** SJF reduces average waiting time compared to FCFS but requires knowledge of burst times beforehand, which may not always be feasible.

Exercise 3: Round Robin (RR) Scheduling

****Problem:**** Using the same processes, with a time quantum of 2 units, calculate average waiting and turnaround times using

Round Robin scheduling. **Solution:** Round Robin cycles through processes, giving each a fixed time slice. 1. **Execution order and Gantt chart slices:** - P1: 0-2 (remaining burst 2) - P2: 2-4 (remaining 1) - P3: 4-5 (remaining 0) - P4: 5-7 (remaining 0) - P1: 7-9 (remaining 0) - P2: 9-10 (remaining 0) 2. **Completion times:** - P3 completes at 5 - P4 completes at 7 - P1 completes at 9 - P2 completes at 10 3. **Turnaround Time:** $TAT = \text{Completion time} - \text{Arrival time}$ - P1: $9 - 0 = 9$ - P2: $10 - 1 = 9$ - P3: $5 - 2 = 3$ - P4: $7 - 3 = 4$ 4. **Waiting Time:** $WT = \text{Turnaround time} - \text{Burst time}$ - P1: $9 - 4 = 5$ - P2: $9 - 3 = 6$ - P3: $3 - 1 = 2$ - P4: $4 - 2 = 2$ 5. **Average Waiting Time:** $(5 + 6 + 2 + 2) / 4 = 15 / 4 = 3.75$ units 6. **Average Turnaround Time:** $(9 + 9 + 3 + 4) / 4 = 25 / 4 = 6.25$ units **Insights:** Round Robin provides better responsiveness, especially in time-sharing systems, but average waiting time may be higher than SJF.

Tips for Solving CPU Scheduling Algorithms Exercises

Working through scheduling problems can sometimes be tricky. Here are a few pointers to make the process smoother: - **Draw Gantt Charts:** Visualizing the order and timing of processes helps avoid mistakes. - **Keep Track of Arrival Times:** Processes may arrive at different times, affecting scheduling. - **Calculate Remaining Burst Time:** Especially important for preemptive algorithms like Round Robin or Preemptive SJF. -

****Double-Check Time Calculations:**** Waiting time, turnaround time, and completion time are interrelated; a small error can cascade. - ****Compare Algorithms Using Metrics:**** Average waiting time, turnaround time, and CPU utilization are key performance indicators.

Advanced Exercise: Priority Scheduling with Preemption

Let's look at a slightly more complex example involving priorities. ****Problem:**** Four processes arrive at time 0 with the following burst times and priorities (lower number means higher priority):

Process	Burst Time	Priority
P1	10	3
P2	1	1
P3	2	4
P4	1	2

Calculate average waiting and turnaround time using preemptive priority scheduling.

****Solution:**** 1. ****Process order:**** Since P2 has highest priority (1), it runs first from 0 to 1. Next is P4 (priority 2), runs 1 to 2. Then P1 (priority 3), but since P3 has priority 4, P1 has higher priority than P3. P1 runs from 2 to 12 (since no higher priority processes arrive). Finally, P3 runs from 12 to 14. 2.

****Completion Times:**** - P2: 1 - P4: 2 - P1: 12 - P3: 14 3.

****Turnaround Time:**** TAT = Completion time - Arrival time (all arrived at 0) - P1: 12 - 0 = 12 - P2: 1 - 0 = 1 - P3: 14 - 0 = 14 -

P4: 2 - 0 = 2 4. ****Waiting Time:**** WT = Turnaround time - Burst time - P1: 12 - 10 = 2 - P2: 1 - 1 = 0 - P3: 14 - 2 = 12 - P4: 2 - 1

= 1 5. ****Average Waiting Time:**** $(2 + 0 + 12 + 1) / 4 = 15 / 4 =$

3.75 units 6. ****Average Turnaround Time:**** $(12 + 1 + 14 + 2) / 4 = 29 / 4 = 7.25$ units ****Insights:**** Preemptive priority scheduling heavily favors high-priority processes but can cause starvation for low-priority ones without aging mechanisms.

CPU Scheduling Algorithms Exercise with Solution: A Professional Review **cpu scheduling algorithms exercise with solution** serves as a critical learning tool for students and professionals aiming to master operating system concepts. The

efficient management of CPU time among multiple processes directly influences system performance and responsiveness. This article delves into a comprehensive examination of CPU scheduling algorithms, presenting exercises alongside detailed solutions to enhance understanding. By dissecting various scheduling strategies, their practical implementations, and problem-solving techniques, the discussion unfolds in a manner that balances theoretical insight with applied learning.

Understanding CPU Scheduling and Its Importance

CPU scheduling is the method by which an operating system allocates the central processing unit's time to various competing processes. Given that CPU time is a finite resource, effective scheduling algorithms are essential to optimize throughput, minimize waiting and turnaround times, and ensure fairness. The study of CPU scheduling algorithms involves both conceptual understanding and practical application, often facilitated through exercises that simulate real-world scenarios. The phrase *cpu scheduling algorithms exercise with solution* encapsulates this approach, combining theoretical models with step-by-step problem-solving. Such exercises typically involve a set of processes characterized by attributes such as arrival time, burst time (CPU execution duration), and priority. The solutions then demonstrate how different algorithms handle

these processes to achieve distinct scheduling outcomes.

Core CPU Scheduling Algorithms: An Analytical Overview

Several foundational CPU scheduling algorithms form the backbone of operating system design. Each algorithm embodies unique principles and trade-offs, which become evident when applied to exercises.

First-Come, First-Served (FCFS)

As the simplest scheduling algorithm, FCFS operates on a straightforward queue basis—processes are executed in the order of their arrival. This method is non-preemptive, meaning once a process starts execution, it runs to completion.

****Exercise Example:**** Consider three processes with the following burst times and arrival times:

1. P1: Arrival Time = 0 ms, Burst Time = 5 ms
2. P2: Arrival Time = 1 ms, Burst Time = 3 ms
3. P3: Arrival Time = 2 ms, Burst Time = 8 ms

****Solution:**** The CPU executes P1 first (0-5 ms), then P2 (5-8 ms), and finally P3 (8-16 ms). The waiting times are calculated as:

1. P1: 0 ms (starts immediately)

2. P2: $5 - 1 = 4$ ms
3. P3: $8 - 2 = 6$ ms

While simple to implement, FCFS can lead to the "convoy effect," where short processes wait excessively behind longer ones.

Shortest Job First (SJF)

SJF selects the process with the shortest burst time next, aiming to minimize average waiting time. It comes in two variants: non-preemptive and preemptive (also called Shortest Remaining Time First). ****Exercise Example:**** Using the previous process set, apply non-preemptive SJF:

1. P1: Arrival Time = 0 ms, Burst Time = 5 ms
2. P2: Arrival Time = 1 ms, Burst Time = 3 ms
3. P3: Arrival Time = 2 ms, Burst Time = 8 ms

****Solution:**** At time 0, only P1 has arrived, so it starts execution. After 5 ms (time 5), P2 and P3 have arrived. Between P2 (3 ms) and P3 (8 ms), P2 has the shorter burst time and is executed next (5-8 ms), followed by P3 (8-16 ms).
Waiting times:

1. P1: 0 ms
2. P2: $5 - 1 = 4$ ms
3. P3: $8 - 2 = 6$ ms

In this case, the results mirror FCFS due to process arrival timings. However, if arrival times differ, SJF can substantially reduce average waiting time.

Round Robin (RR)

Round Robin scheduling introduces time slicing, allotting each process a fixed quantum of CPU time in a cyclic order. It is designed to improve responsiveness, especially in time-sharing systems. ****Exercise Example:**** Using the same three processes, quantum = 3 ms. ****Solution:****

1. Time 0-3: P1 executes (remaining burst time 2 ms)
2. Time 3-6: P2 executes (remaining burst time 0 ms, completes)
3. Time 6-9: P3 executes (remaining burst time 5 ms)
4. Time 9-11: P1 executes (completes)
5. Time 11-16: P3 executes (completes)

This preemptive approach ensures no process monopolizes the CPU but may increase context switching overhead and average turnaround time if the quantum is poorly chosen.

Priority Scheduling

Priority scheduling assigns a priority level to each process, executing higher-priority processes first. It can be preemptive or non-preemptive. ****Exercise Example:**** Add priority levels to the

previous set:

1. P1: Priority 2
2. P2: Priority 1 (highest)
3. P3: Priority 3

****Solution:**** P2 runs first (highest priority), followed by P1, then P3. The arrival times will influence when each process starts. This method risks starvation of lower-priority processes unless aging techniques are applied.

Key Metrics and Their Calculation in Exercises

When tackling cpu scheduling algorithms exercise with solution, several metrics are crucial to evaluate algorithm performance:

1. **Waiting Time (WT):** Time a process spends waiting in the ready queue.
2. **Turnaround Time (TAT):** Total time from arrival to completion.
3. **Response Time:** Time from arrival until the first execution.
4. **Throughput:** Number of processes completed per unit time.

Exercises commonly present process parameters and require computing these metrics under different algorithms. Systematic calculation of these values reveals the strengths and weaknesses of each scheduling technique under varying

workloads.

Practical Exercise: Multi-Algorithm Comparison

To illustrate the practical application of cpu scheduling algorithms exercise with solution, consider a scenario with four processes:

1. P1: Arrival Time = 0 ms, Burst Time = 7 ms, Priority = 2
2. P2: Arrival Time = 2 ms, Burst Time = 4 ms, Priority = 1
3. P3: Arrival Time = 4 ms, Burst Time = 1 ms, Priority = 3
4. P4: Arrival Time = 5 ms, Burst Time = 4 ms, Priority = 2

Applying FCFS, SJF, RR (quantum = 3 ms), and Priority Scheduling to these processes generates distinct execution sequences and performance metrics. This multi-algorithm exercise enables learners to:

1. Visualize Gantt charts for each method.
2. Calculate average waiting and turnaround times.
3. Understand the impact of arrival times and priorities.
4. Recognize the trade-offs between fairness, efficiency, and complexity.

Such exercises embody the essence of cpu scheduling algorithms exercise with solution, fostering a hands-on grasp of the underlying mechanics.

Advanced Considerations in CPU Scheduling Exercises

While basic algorithms provide foundational knowledge, real-world operating systems often employ hybrid or adaptive scheduling strategies. Exercises incorporating dynamic priorities, multilevel queues, or feedback mechanisms challenge learners to navigate complexity. For example, multilevel queue scheduling divides processes into categories (foreground, background), each with its own scheduling policy. Exercises may require simulating such environments and analyzing the impact on system responsiveness. Moreover, incorporating context switch overhead in solutions adds realism, emphasizing the cost-benefit analysis of preemptive algorithms.

Tips for reading Cpu Scheduling Algorithms Exercise With Solution

Reading Cpu Scheduling Algorithms Exercise With Solution in digital format can be a highly effective and enjoyable experience when done with the right approach. Unlike traditional printed books, digital reading offers flexibility, customization, and powerful tools that can improve comprehension and retention. However, without proper habits, digital reading can also lead to fatigue or reduced focus. Applying practical reading strategies helps you get the most value from Cpu Scheduling Algorithms Exercise With Solution.

One of the most important tips is to break your reading into manageable sessions. Long, uninterrupted reading on a screen can strain the eyes and reduce concentration. Instead of reading for several hours at once, divide your time into shorter sessions with regular breaks. This approach helps maintain focus, improves understanding, and prevents mental

exhaustion. Using techniques such as the Pomodoro method—reading for 25–30 minutes followed by a short break—can be particularly effective.

Using bookmarks is another simple yet powerful habit. Most digital reading platforms allow you to bookmark chapters, sections, or specific pages. Bookmarks make it easy to return to important parts of *Cpu Scheduling Algorithms Exercise With Solution* without scrolling or searching manually. This is especially useful for long documents, study materials, or reference-based reading where you may need to revisit certain sections frequently.

Highlighting key points and adding annotations can significantly improve comprehension. Digital highlights allow you to visually mark important ideas, definitions, or summaries. Adding notes in your own words helps reinforce understanding and creates a personalized study guide. Over time, these highlights and annotations turn *Cpu Scheduling Algorithms Exercise With Solution* into an interactive learning resource rather than passive reading material.

Adjusting screen settings plays a crucial role in reading comfort. Most reading apps allow you to customize font size, font style, line spacing, and background color. Increasing font size and line spacing can reduce eye strain, while using dark mode or

sepia backgrounds may improve readability in low-light environments. Adjusting screen brightness to match ambient lighting further enhances comfort and protects eye health during long reading sessions.

Creating a focused reading environment

A distraction-free environment improves reading efficiency and enjoyment. When reading Cpu Scheduling Algorithms Exercise With Solution, try to minimize notifications from messaging apps or social media. Many devices offer “focus mode” or “do not disturb” settings that help maintain concentration. Choosing a quiet, comfortable location with proper lighting also contributes to a better reading experience.

For study or professional reading, setting clear goals before starting can be beneficial. Decide whether you are reading for general understanding, detailed analysis, or quick reference. Clear objectives help guide how deeply you engage with the content and which sections deserve closer attention.

Text automatically adjusts to different screen sizes, allowing comfortable reading on smartphones and dedicated eReaders. If you prioritize readability and customization, ePub is often the best choice for reading Cpu Scheduling Algorithms Exercise With Solution on the go. However, complex layouts may not always appear exactly as intended.

Audiobook format:

Audiobooks offer an alternative way to experience Cpu Scheduling Algorithms Exercise With Solution content. Instead of reading text, users listen to narrated versions. Audiobooks are ideal for multitasking, commuting, or users who prefer auditory learning. While they do not allow highlighting or visual

reference, they provide accessibility and convenience for busy lifestyles.

This feature is invaluable for research, study, and professional reference, saving time and improving efficiency.

Offline access enhances flexibility. Once downloaded, digital copies of Cpu Scheduling Algorithms Exercise With Solution

can be accessed without an internet connection. This is especially useful for travel, remote study, or areas with limited connectivity. Offline access ensures uninterrupted reading regardless of location.

Annotation tools add further value. Highlights, notes, and bookmarks transform digital reading into an interactive experience. These tools help readers organize information, revisit important sections, and personalize their learning process. Notes can often be exported or synced across devices, providing continuity and convenience.

Cost and sustainability advantages

Digital copies are often more affordable than printed books. Many platforms offer discounts, subscription models, or free access to public domain works. Over time, digital reading can significantly reduce costs for students, professionals, and avid readers.

Balancing digital and traditional reading

While digital copies offer many benefits, balancing them with healthy reading habits is important.
